Department of Mental Health Law & Policy
University of South Florida

Introduction

The Florida Mental Health Act, also known as the “Baker Act,” includes several data reporting requirements. Section 394.463(2)(e), Florida Statutes, requires the Florida Department of Children and Families (Department) to publish an annual report. Florida Administrative Code 65E-5 specifies data submission requirements and that forms be submitted by Baker Act Receiving Facilities to the Baker Act Reporting Center at the University of South Florida. Forms must be submitted to the Baker Act Reporting Center within five working days after the person arrived at the receiving facility. Required forms include:

Form ¹	Form Name
<i>The underlined text below and elsewhere in this report indicates a hyperlink to a webpage. The links below will bring you to each form on the Department’s web page.</i>	
<u>CF-MH 3052a</u>	Report of Law Enforcement Officer Initiating Involuntary Exam
<u>CF-MH 3052b</u>	Certificate of Professional Initiating Involuntary Exam
<u>CF-MH 3001</u>	Ex Parte Order for Involuntary Exam
<u>CF- MH 3118</u>	Cover Sheet to Department of Children and Families

The Cover Sheet (CF-MH 3118) systematically reports demographic and provider information that corresponds to any of the forms (CF-MH3052a, CF-MH3052b, and CF-MH3001) listed above. Links to the statute, administrative code, forms, and other materials can be found on the Department of Children and Families (Department) Crisis Services – Baker Act web page. The Baker Act Reporting Center receives these documents, enters data from them, and produces reports on behalf of the Department. The Baker Act Reporting Center is housed in the Department of Mental Health Law and Policy, de la Parte Florida Mental Health Institute, College of Behavioral and Community Sciences at the University of South Florida. See the Baker Act Reporting Center website for additional information.

This supplemental report is an expansion of Florida counties listed in the Baker Act Annual Report for Fiscal Year (FY) 2019-2020. The second page of information for each county in this document contains information at the person level that is not contained in the original report. Readers are encouraged to view the full FY19/20 Baker Act Annual Report on our website at <https://www.usf.edu/cbcs/baker-act/>.

Additional Technical Notes

The Baker Act data analyzed for this report are from involuntary exam forms received by the Baker Act Reporting Center. Some individuals for whom forms were received were never admitted to the receiving facility because an exam by a physician or psychologist performed prior to admission determined they did not meet admission criteria. The data also do not include information on what occurred after the initial exam. For example, the data do not reveal how long individuals stayed at the facility, whether they remained on an involuntary or voluntary basis, or whether the involuntary (Baker Act) exam was converted to a Marchman Act assessment. Because not everyone who has an involuntary exam initiated is admitted to a Baker Act receiving facility, the data in this report are of *involuntary exams*, not admissions data or not counts of *voluntary exams*.

Redaction: Small cell sizes were redacted from this report. This redaction is done to prevent identification of people. The** symbol is contained in cells (and their associated percentages) that are below 10. The maximum count of repeated involuntary examinations we report varies across counties in order to redact for small cells sizes.

Counts of Involuntary Exams vs. Counts of People: This report includes both counts of involuntary exams (Section III) and counts of people who received involuntary exams (Section IV). These categories were reported separately to avoid confusion. Those who write about the findings of this report are cautioned to be careful to not confuse counts of involuntary exams with counts of people who received involuntary exams.

Percent Change: Percent change is reported throughout this report. This is a helpful metric that can put counts of involuntary exams into context. However, certain issues with using percent change need to be considered. Percent change needs to be interpreted carefully when the change is between small numbers. For example, an increase in County A from 4 to 8 is a 100% increase, just as a change in County B from 1,000 to 2,000 is a 100% increase. *The challenge is to interpret what importance should be given to this percent change when determining whether there is a problem to be addressed and how to address it.* What these counts represent out of the total population needs to also be considered. For example, County A has a population of 50,000. Four equals a rate of 8 per 100,000, while 8 equals a rate of 16 per 100,000 for County A. County B has a population of 500,000. This means that 1,000 equals a rate of 200 per 100,000 and 2,000 equals a rate of 400 per 100,000. The rate in County B is much higher than the rate in County A even though the percent increase is the same. Some counties may have large percentages of change, but because their counts were low in relation to other counties to begin with, the increase over time may still mean that their rate per 100,000 is still smaller relative to other counties.

Context Matters: What is being measured matters. Let's say it is readmissions to a state hospital over a three-year period that is being measured. An increase from 8 to 16 may have meaning. But if we are measuring, for example, deaths by suicide for 12 to 14-year-old youth, this same 100% increase from 8 to 16 may be meaningful in a different way, and perhaps more concerning. What is occurring at the state level and in the community of focus as it relates to what is being measured needs to be considered. Was there some sort of catastrophic event, such as a hurricane or a severe

economic downturn? How do the characteristics of the community of focus impact what is being measured, and perhaps in a different way to other communities to which a comparison is being drawn. Is access to service different between the two communities being compared, such as access to Baker Act receiving facilities? The point here is that the percent change is just a number. Figuring out what it means and how to compare it between communities requires learning more about those communities. The numbers in this report are only a start to understanding relevant issues.

There are complex reasons for the lower numbers of involuntary exams in some areas and higher numbers in other areas. Readers of this report are urged to consider these factors when interpreting the results. For example, the distribution of Baker Act receiving facilities statewide is not uniform. About half of Florida's 67 counties have at least one Baker Act receiving facility and the others do not have any. Areas of some counties are geographically distant from the nearest receiving facility. Additional factors may influence the use of involuntary exams, such as:

- Number of people trained in Mental Health First Aid;
- Law enforcement training, including Crisis Intervention Training (CIT);
- Availability of criminal justice system diversion programs at all sequential intercepts, including those funded by Criminal Justice, Mental Health, and Substance Abuse (CJMHS) Reinvestment Grants;
- Availability and quality of community-based behavioral health services, including Mobile Response Teams (MRTs), Florida Assertive Community Treatment (FACT) and Community Action Treatment (CAT) Teams;
- Availability of a wide array of social services, such as assistance with housing, coverage for health care, and existence of county funds for those who are underinsured or uninsured; and
- How facilities approach the admission status (voluntary or involuntary) for children based on the logistics of holding the required voluntariness hearing for children.

Terminology: Involuntary exams occur at designated *receiving facilities*. Receiving facilities may include hospitals (licensed under Chapter 395, F.S.) and Crisis Stabilization Units (licensed under Chapter 394, F.S.). The Department designates all Baker Act receiving facilities regardless of type. Some receiving facilities are called Crisis Stabilization Units (CSUs). CSUs are usually residential units of community mental health centers and receive Department funds for Baker Act services. CSUs designated for children are referred to as Children's Crisis Stabilization Units (CCSUs). This means that while all CSUs/CCSUs are Baker Act receiving facilities, not all Baker Act receiving facilities are CSUs. The abbreviations CSU and CCSU are used throughout this report. Receiving facilities that are provided funds from the Department are referred to later in this report as "public," while those not receiving such funds are referred to as "private."

Unknown/Not Reported Values: The age necessary for analyses by age groups is computed by subtracting the person's date of birth as reported on the Cover Sheet (form CF-MH3118) from the date of exam initiation on the law enforcement initiation form, professional certificate or ex-parte order. Age cannot be determined and is reported as "unknown" if the date of birth is not provided or if it is not legible. The county of residence reported on the Cover Sheet is used to categorize involuntary exams geographically, such as by Department Region, Managing Entity area, and Judicial Circuitry. The "not reported" category for presentation of information by geographic areas means that the county of residence was not reported on the Cover Sheet.

Population Statistics: Population statistics are provided in some tables to put counts of involuntary exams in context. Population estimates were obtained from the Florida Office of Economic and Demographic Research. County level characteristics were obtained from the Florida Department of Health, Division of Public Health Statistics and Performance Management, and Florida Health Charts. While this report focuses on counts by fiscal years, estimates of population are available by calendar year. Logical calendar year spans are used to provide context.

Unique Person Identifier: A unique person identifier was created using available data. Social security number could have been used as a unique identifier if the data were complete enough for this purpose. The Cover Sheet (form CF-MH3118) requires reporting of the full social security number. However, the percentage of missing social security numbers precluded researchers from using it as a unique person identifier.

Link King software was used to identify individuals and create a unique id using both deterministic and probabilistic matching algorithms. The probabilistic algorithms used by *Link King* were developed by MEDSTAT for the Substance Abuse and Mental Health Administration's (SAMHSA) Integrated database project. The program is capable of recognizing use of nicknames, hyphenated names, misspelled names, transposed social security number digits, and transposed date fields. A minimum of first name, last name, and either date of birth or social security number is required for matching. There were only 463 records of involuntary exams in Fiscal Year 2019-2020 that did not have the minimum information for matching. Uncertain matches and a sample of successfully matched records were manually reviewed for accuracy.

Counting Repeated Involuntary Exams: The Unique Person Identifier was used to count repeated involuntary exams. The count of repeated involuntary exams is provided for adults and children in the county tables and for all ages, adults and children earlier in the report at the statewide level. Involuntary exams for which age is not known cannot be included in tables that report results for adults and children because the age is necessary to categorize people into age groups. Also, people who have at least one exam as a child and one as an adult during the year were counted in both the adult and child tables. For example, a person who during the year had two involuntary exams when they were 17, and one after they turned 18 would count as one person with three involuntary exams in the all-ages table, as one adult with two exams in the adult table, and one child with one exam in the child table. For these reasons, the counts of people and exams in the tables counting repeated exams do not add up to the total of people and exams earlier in the report. The counts of people for all ages also varies slightly from the combined counts of adults and children. These differences are small and do not impact the overall meaning of the results.

To look at repeated involuntary exams for adults, first the number of adults with one exam is counted, two exams, three exams, and so forth on up to the person with the most exams in the year. Counts of the number of exams in a year is in Column number one below. Grouping numbers of exams into categories at higher numbers of exams (such as 6-10, and 11+) to avoid reporting of small cell sizes was then done. For example, 76,186 adults (column 2) accounting for 74.03% of adults with involuntary exams in Fiscal Year 2019-2020 (column 3) had one involuntary exam, 14,810 (column 1) had two involuntary exams accounting for 14.29% of people with involuntary exams (column 3) and so forth.

The number reported in columns 4 and 5 allow the percentage of exams out of the total number of exams that people with various numbers of involuntary exams account for during Fiscal Year 2019-2020 to be seen. For example, while the 649 adults with 11 or more involuntary exams accounted for less than 1% of adults with an involuntary exam, their exams accounted for 6.47% of the total adults for exams for the year.

Example Table: Repeated Involuntary Exams for Adults Statewide in Fiscal Year 2019-2020

1	2	3	4	5
Exams FY19-20	Count of Adults	% Adults	Count of Exams	% Exams
1	76,186	74.03%	76,186	46.23%

Florida

This page is provided to facilitate the comparison of following pages with county level information to statewide values.

Part I: Involuntary Examination Level Analyses (Statewide)

Physician (but not a Psychiatrist) (65.55%) were the most common health professionals to initiate involuntary examinations, followed by Mental Health Counselor (11.35%), Psychiatrist (9.21%), Clinical Social Worker (5.91%), Psychiatric Nurse (1.94%), Not Reported (1.80%), Clinical Psychologist (1.36%), Physician's Assistant (1.19%), Multiple MHP types entered (1.18%), and Marriage and Family Therapist (<1%).

Information about involuntary examinations of Florida residents for five years is shown in Table A.

Table A: Involuntary Examinations: Residents of Florida for Five Years*

Year	Involuntary Examinations											
	Involuntary Exams (All Ages)	% of Total				% of Total by Initiator Type			% Change from			
		<18	18-24	25-64	65+	Law Enforcement	Health Professional	Ex-Parte	1 Year		5 Years

2015-2016	194,354	16.70%	13.31%	62.17%	7.10%	50.86%	47.27%	1.88%				

*Population estimates are available by calendar year only. Calendar year 2018 population estimates were used for the row showing FY18/19 data, 2017 for the row for FY17/18 data and so on.

Part II: Person Level Analyses (Statewide)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.

Table B: People with Involuntary Examinations in Fiscal Year 2019/2020 Statewide

Age Groups	Total People	% Gender			% Race				% Hispanic Origin		
		Male	Female	Not Reported	White	Black	Other	Not Reported	Yes	No	Not Reported

County: Alachua

This county page can be compared to the counts in the [Florida Statewide Totals on page 62](#). Alachua County is in the Department's Northeast region and Florida Judicial Circuit 8. Lutheran Services Florida is the Managing Entity for Alachua County. In Fiscal Year 2019/2020 there were 1,953 involuntary examinations for 267,935 residents of Alachua County.

Part I: Involuntary Examination Level Analyses:

The majority of Alachua County residents who received an involuntary examination were seen at UF Health Shands Psychiatric Hospital (56.22%), North Florida Regional Medical Center (18.07%), Meridian Behavioral Health Care (Gainesville) (8.45%), and UF Health Shands Hospital (5.27%).

Physicians (but not a Psychiatrists (63.82%) were the most common health professionals to initiate involuntary examinations, followed by Mental Health Counselors (19.69%), Psychiatrists (7.17%), Clinical Social Workers (3.71%), Not Reported (2.85%), Psychiatric Nurses (1.47%), Multiple MHP types entered (<1%), Clinical Psychologists (<1%), Physician's Assistants (<1%), and Marriage and Family Therapists (<1%).

Information about involuntary examinations of Alachua County residents for five years is shown in Table A.

Table A: Involuntary Examinations: Residents of Alachua County for Five Years*

Year	Involuntary Examinations											
	Involuntary Exams (All Ages)	% of Total				% of Total by Initiator Type			% Change from			
		<18	18-24	25-64	65+	Law Enforcement	Health Professional	Ex-Parte	1 Year		5 Years

County: Baker

This county page can be compared to the counts the [Florida Statewide Totals on page 62](#). Baker County is in the Department's Northeast region and Florida Judicial Circuit 8. Lutheran Services Florida is the Managing Entity for Baker County. In Fiscal Year 2019/2020 there were 218 involuntary examinations for 28,317 residents of Baker County.

Part I: Involuntary Examination Level Analyses:

The majority of Baker County residents who received an involuntary examination were seen at Meridian Behavioral Health Care (Lake City) (50.46%), North Florida Regional Medical Center (5.96%), Orange Park Medical Center (5.96%), and Mental Health Resource Center - North (5.05%).

Physicians (but not a Psychiatrists (70.00%) were the most common health professionals to initiate involuntary examinations, followed by Mental Health Counselors (22.50%), Clinical Social Workers (2.50%), Psychiatrists (2.50%), Multiple MHP types entered (1.25%), Not Reported (1.25%), Psychiatric Nurses (<1%), Physician's Assistants (<1%), Clinical Psychologists (<1%), and Marriage and Family Therapists (<1%).

Information about involuntary examinations of Baker County residents for five years is shown in Table A.

Part II: Person Level Analyses: (Baker)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.

Part II: Person Level Analyses: (Collier)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.

Part II: Person Level Analyses: (Hendry)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.

Part II: Person Level Analyses: (Madison)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.

Part II: Person Level Analyses: (Pinellas)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.

Part II: Person Level Analyses: (Walton)

The counts in this section are at the person level, not at the involuntary examination level. There are more involuntary examinations each year than people with involuntary examinations because some people have more than one involuntary examination. Demographic variables were used to create a unique person identifier for people subject to involuntary examinations using probabilistic matching concepts.
